Service Levels Sprint 4

Andres Romero, Randal Guzman, Esteban Navar, Carlos Adrian Yanez Duron

Targets:

Field	*SLI 1: Reminder delivery (correctness and latency)*	*SLI 2: Site availability (availability)*
Definition	Share of maintenance reminders that are delivered correctly and within 5 minutes of their scheduled time	Share of minutes in which the site answers a check successfully
Measurement	Reminder delivery log, reviewed every Friday by the System Administrator	Free uptime monitor, reviewed every Friday by the System Administrator
SLO	99.9% of reminders correct and within 5 minutes in each sprint	99% uptime in each sprint. About 200 minutes of allowed downtime
Rule check	Not copied from a big company, one simple share, no absolutes	One simple share, 99% not 100%, one of only two SLOs
Who would notice	A user who misses a service because a reminder was late, wrong or missing	A user who cannot open the app or save an entry

	Reminder delivery	*Site availability*
SLI	Share of reminders delivered correctly and within 5 minutes of their scheduled time	Share of minutes the site answers a check successfully
SLO	99.9% each sprint	99% each sprint
SLA	If fewer than 95% of reminders are on time in a month, affected users get a free trial of a paid feature	If monthly uptime falls below 97%, users get a free trial of a paid feature

Error Budget:

Field	*Objective 1: Reminder delivery*	*Objective 2: Site availability*
Objective	99.9% of reminders correct and within 5 minutes, each sprint	99% uptime, each sprint
Budget	0.1% of reminders. At about 5,000 reminders per sprint that is 5 misses per sprint.	1% of 20,160 minutes in a 2 week sprint, which is about 200 minutes of downtime per sprint.

Field	*Objective 1: Reminder delivery*	*Objective 2: Site availability*
Policy action	If more than 5 reminders miss in a sprint, new feature work pauses. The fixers review the reminder log, find the cause, and add a test or check for it before new work starts.	If downtime passes 200 minutes, releases pause. The fixers find the cause and add a health check or rollback before the next release.
Owner	Incident commander	Incident commander
Who we tell, and when	The Project Sponsor in the next weekly update. The users by the end of the week.	The Project Sponsor in the weekly update or sooner if the next release is within 2 days. The users by the end of the week.

Escalation Paths:

Level	*Example on our project*	*Start fixing*	*Tell the stakeholders*
Severity 1	The site is down, no reminders are sending, or the portal is down within 2 days of a release	Within 2 hours	Within 4 hours
Severity 2	Reminders are late or wrong for some users, a required page or a link on it is broken, or an error budget is spent	Within 24 hours	In the weekly update
Severity 3	Content is stale or a small display problem, with budget still left	By the next weekly check	Only if it repeats

Role	*This sprint*
Incident commander	Andres Romero
Fixers	Randal Guzman, Carlos Adrian Yanez Duron
Communicator	Esteban Navar

Incident Review:

Section	*Review*
1. Summary	The estimation worksheet and one-page budget were initially built based on the capacity of a student team working on the project. The project assumes full-time work, so we corrected it to 80 hours per person per sprint and every number that depends on it was recalculated.

Section	*Review*
2. Impact	Velocity, sprints needed, effort hours, FTE-months, labor cost and contingency had to be recalculated in two documents. The budget request is now $45,657. We spent around an hour redoing the work.
3. Timeline	9/29: worksheet completed at 40 hours per person per sprint. 10/1: mistake mentioned and identified in class. 10/2: team confirmed the full-time basis of 80 hours. 10/4: both documents correctly updated.
4. Contributing causes	The capacity assumption was never clarified with the professor before estimating. We did not notice the mistake until it was mentioned in class, so the mismatch was not caught until late.
5. What went well	The mismatch was found before the final submission. The recalculation reused one set of formulas. We recorded this change in the change log.

Action Items:

Action	*Owner*	*Date*
Clarify any unknowns with the professor before beginning work on the sprint deliverables.	Project Manager	Starting Sprint 5, before beginning each sprint
Before each submission, the team checks that numbers and assumptions match across all documents.	Project Manager	Starting Sprint 5, before each submission
